## pander(cn\_urban\_notes)

| Note Number (*) | Notes  |
|-----------------|--|
| 1               | Average runoff condition, and $Ia = 0.2S$ .    |
|                 | {Table 2-2a: Runoff curve numbers for urban    |
|                 | areas *1}                                      |
| 2               | The average percent impervious area shown      |
|                 | was used to develop the composite CN's.        |
|                 | Other assumptions are as follows:              |
|                 | impervious areas are directly connected to     |
|                 | the drainage system, impervious areas have     |
|                 | a CN of 98, and pervious areas are             |
|                 | considered equivalent to open space in good    |
|                 | hydrologic condition. CN's for other           |
|                 | combinations of conditions may be computed     |
|                 | using figure 2-3 or 2-4.                       |
| 3               | CN's shown are equivalent to those of          |
|                 | pasture. Composite CN's may be computed        |
|                 | for other combinations of open space cover     |
|                 | type.  |
| 4               | Composite CN's for natural desert              |
|                 | landscaping should be computed using           |
|                 | figures 2-3 or 2-4 based on the impervious     |
|                 | area percentage ( $CN = 98$ ) and the pervious |
|                 | area CN. The pervious area CN's are            |
|                 | assumed equivalent to desert shrub in poor     |
|                 | hydrologic condition.                          |

| Note Number (*) | Notes                                      |
|-----------------|--|
| 5               | Composite CN's to use for the design of    |
|                 | temporary measures during grading and      |
|                 | construction should be computed using      |
|                 | figure 2-3 or 2-4 based on the degree of   |
|                 | development (impervious area percentage)   |
|                 | and the CN's for the newly graded pervious |
|                 | areas.                                     |

## pander(cn\_agricultural\_notes)

| Note Number (*) | Notes   |
|-----------------|---|
| 1               | Average runoff condition, and Ia=0.2S {Table 2-2b: Runoff curve numbers for     |
| 2               | cultivated agricultural lands *1} Crop residue cover applies only if residue is |
| 2               | on at least 5% of the surface throughout the                                    |
|                 | year.   |

| Note Number (*) | Notes   |
|-----------------|---|
| 3               | Hydraulic condition is based on combination factors that affect infiltration and runoff,  |
|                 | including (a) density and canopy of<br>vegetative areas, (b) amount of year-round<br>cover, (c) amount of grass or close-seeded |
|                 | legumes, (d) percent of residue cover on the land surface (good 20%), and (e) degree of surface roughness.                      |
| 3               | Poor: Factors impair infiltration and tend to increase runoff.  |
| 3               | Good: Factors encourage average and better than average infiltration and tend to decrease runoff.                               |

Table 29: Table continues below

#### Sources of Contaminant in Drinking Water

Human and animal fecal waste
Human and animal fecal waste
HPC measures a range of bacteria that are
naturally present in the environment
Found naturally in water; multiplies in
heating systems

Coliforms are naturally present in the environment; as well as feces; fecal coliforms and E. coli only come from human and animal fecal waste.

#### Soil runoff

Human and animal fecal waste
Byproduct of drinking water disinfection
Water additive used to control microbes
Water additive used to control microbes
Water additive used to control microbes
Discharge from petroleum refineries; fire
retardants; ceramics; electronics; solder
Erosion of natural deposits; runoff from
orchards, runoff from glass and electronics
production wastes

Decay of asbestos cement in water mains; erosion of natural deposits

Discharge of drilling wastes; discharge from metal refineries; erosion of natural deposits

Discharge from metal refineries and coal-burning factories; discharge from electrical, aerospace, and defense industries

Corrosion of galvanized pipes; erosion of natural deposits; discharge from metal refineries; runoff from waste batteries and paints

Discharge from steel and pulp mills; erosion of natural deposits Corrosion of household plumbing systems; erosion of natural deposits

#### Sources of Contaminant in Drinking Water

Discharge from steel/metal factories; discharge from plastic and fertilizer factories Water additive which promotes strong teeth; erosion of natural deposits; discharge from fertilizer and aluminum factories

Corrosion of household plumbing systems; erosion of natural deposits

Erosion of natural deposits; discharge from refineries and factories; runoff from landfills and croplands

Runoff from fertilizer use; leaking from septic tanks, sewage; erosion of natural deposits Runoff from fertilizer use; leaking from septic tanks, sewage; erosion of natural deposits Discharge from petroleum refineries; erosion of natural deposits; discharge from mines Leaching from ore-processing sites; discharge from electronics, glass, and drug factories Added to water during sewage/wastewater treatment

Runoff from herbicide used on row crops Runoff from herbicide used on row crops Discharge from factories; leaching from gas storage tanks and landfills

Leaching from linings of water storage tanks and distribution lines

Leaching of soil fumigant used on rice and alfalfa

Discharge from chemical plants and other industrial activities

Residue of banned termiticide Discharge from chemical and agricultural chemical factories

Runoff from herbicide used on row crops Runoff from herbicide used on rights of way Runoff/leaching from soil fumigant used on soybeans, cotton, pineapples, and orchards Discharge from industrial chemical factories Discharge from drug and chemical factories Discharge from industrial chemical factories Discharge from industrial chemical factories

Discharge from chemical factories
Discharge from rubber and chemical factories
Runoff from herbicide used on soybeans and
vegetables

Emissions from waste incineration and other combustion; discharge from chemical factories Runoff from herbicide use

### Sources of Contaminant in Drinking Water

Runoff from herbicide use
Residue of banned insecticide
Discharge from industrial chemical factories;
an impurity of some water treatment
chemicals

Discharge from petroleum refineries Discharge from petroleum refineries Runoff from herbicide use Residue of banned termiticide

esique of banned termiticide Breakdown of heptachlor

Discharge from metal refineries and agricultural chemical factories

Discharge from chemical factories Runoff/leaching from insecticide used on cattle, lumber, gardens

Runoff/leaching from insecticide used on fruits, vegetables, alfalfa, livestock

Runoff/leaching from insecticide used on apples, potatoes, and tomatoes

Runoff from landfills; discharge of waste chemicals

Discharge from wood preserving factories
Herbicide runoff
Herbicide runoff

Discharge from rubber and plastic factories; leaching from landfills

Discharge from factories and dry cleaners
Discharge from petroleum factories

Runoff/leaching from insecticide used on cotton and cattle

Residue of banned herbicide
Discharge from textile finishing factories
Discharge from metal degreasing sites and
other factories

Discharge from industrial chemical factories Discharge from metal degreasing sites and other factories

Leaching from PVC pipes; discharge from plastic factories

Discharge from petroleum factories; discharge from chemical factories

Erosion of natural deposits of certain minerals that are radioactive and may emit a form of radiation known as alpha radiation

Decay of natural and man-made deposits of certain minerals that are radioactive and may emit forms of radiation known as photons and beta radiation

Erosion of natural deposits Erosion of natural deposits

| Note Number (*) | Notes  |
|-----------------|--|
| 1               | Definitions:   |
| 1               | Maximum Contaminant Level Goal (MCLG)  - The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety and are non-enforceable public health goals.                                      |
| 1               | Maximum Contaminant Level (MCL) - The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to MCLGs as feasible using the best available treatment technology and taking cost into consideration. MCLs are enforceable standards. |
| 1               | Maximum Residual Disinfectant Level Goal (MRDLG) - The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.            |
| 1               | Treatment Technique (TT) - A required process intended to reduce the level of a contaminant in drinking water.   |
| 1               | Maximum Residual Disinfectant Level (MRDL) - The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.   |
| 2               | Units are in milligrams per liter (mg/L) unless otherwise noted. Milligrams per liter are equivalent to parts per million (PPM).   |
| 3               | EPA's surface water treatment rules require<br>systems using surface water or ground water<br>under the direct influence of surface water to   |
| 3.a             | Disinfect their water, and   |
| 3.b             | Filter their water, or   |
| 3.c             | Meet criteria for avoiding filtration so that<br>the following contaminants are controlled at<br>the following levels:   |
| 3.c             | Cryptosporidium: Unfiltered systems are<br>required to include Cryptosporidium in their<br>existing watershed control provisions   |
| 3.c             | Giardia lamblia: 99.9% removal/inactivation.   |
| 3.c             | Viruses: $99.99\%$ removal/inactivation.   |

| Note Number (*) | Notes  |
|-----------------|--|
| 3.c             | Legionella: No limit, but EPA believes that if Giardia and viruses are removed/inactivated, according to the treatment techniques in the Surface Water Treatment Rule, Legionella will also be controlled.   |
| 3.c             | Turbidity: For systems that use conventional or direct filtration, at no time can turbidity (cloudiness of water) go higher than 1  Nephelometric Turbidity Unit (NTU), and samples for turbidity must be less than or equal to 0.3 NTUs in at least 95 percent of the samples in any month. Systems that use filtration other than the conventional or direct filtration must follow state limits, which must include turbidity at no time exceeding 5 NTUs.                                  |
| 3.c             | Heterotrophic Plate Count (HPC): No more than 500 bacterial colonies per milliliter.   |
| 3.c             | Long Term 1 Enhanced Surface Water Treatment: Surface water systems or groundwater under the direct influence (GWUDI) systems serving fewer than 10,000 people must comply with the applicable Long Term 1 Enhanced Surface Water Treatment Rule provisions (such as turbidity standards, individual filter monitoring, Cryptosporidium removal requirements, updated watershed control requirements for unfiltered systems).  |
| 3.c             | Long Term 2 Enhanced Surface Water Treatment Rule: This rule applies to all surface water systems or ground water systems under the direct influence of surface water. The rule targets additional Cryptosporidium treatment requirements for higher risk systems and includes provisions to reduce risks from uncovered finished water storage facilities and to ensure that the systems maintain microbial protection as they take steps to reduce the formation of disinfection byproducts. |
| 3.c             | Filter Backwash Recycling: This rule requires systems that recycle to return specific recycle flows through all processes of the system's existing conventional or direct filtration system or at an alternate location approved by the state.   |

| Note Number (*) | Notes  |
|-----------------|--|
| 4               | No more than 5.0% samples total coliform-positive (TC-positive) in a month.                  |
|                 | (For water systems that collect fewer than 40  |
|                 | routine samples per month, no more than  |
|                 | one sample can be total coliform-positive per  |
|                 | month.) Every sample that has total  |
|                 | coliform must be analyzed for either fecal coliforms or E. coli if two consecutive           |
|                 | TC-positive samples, and one is also positive  |
|                 | for E.coli fecal coliforms, system has an acute MCL violation.                               |
| 5               | Fecal coliform and E. coli are bacteria whose  |
|                 | presence indicates that the water may be   |
|                 | contaminated with human or animal wastes.  |
|                 | Disease-causing microbes (pathogens) in  |
|                 | these wastes can cause diarrhea, cramps,   |
|                 | nausea, headaches, or other symptoms.  |
|                 | These pathogens may pose a special health  |
|                 | risk for infants, young children, and people with severely compromised immune systems.       |
| 6               | Although there is no collective MCLG for   |
| v               | this contaminant group, there are individual   |
|                 | MCLGs for some of the individual   |
|                 | contaminants:  |
| 6               | Trihalomethanes: bromodichloromethane  |
|                 | (zero); bromoform (zero);  |
|                 | dibromochloromethane $(0.06 \text{ mg/L})$ :   |
| 6               | chloroform (0.07 mg/L.<br>Haloacetic acids: dichloroacetic acid (zero);                      |
| O               | trichloroacetic acid (0.02 mg/L);  |
|                 | monochloroacetic acid (0.07mg/L).  |
|                 | Bromoacetic acid and dibromoacetic acid are  |
|                 | regulated with this group but have no  |
| _               | MCLGs.   |
| 7               | Lead and copper are regulated by a   |
|                 | treatment technique that requires systems to<br>control the corrosiveness of their water. If |
|                 | more than 10% of tap water samples exceed  |
|                 | the action level, water systems must take  |
|                 | additional steps. For copper, the action level   |
|                 | is $1.3 \text{ mg/L}$ , and for lead is $0.015 \text{ mg/L}$ .                               |
| 8               | Each water system must certify, in writing,  |
|                 | to the state (using third-party or   |
|                 | manufacturer's certification) that when  |
|                 | acrylamide and epichlorohydrin are used to<br>treat water, the combination (or product) of   |
|                 | dose and monomer level does not exceed the   |
|                 | levels specified, as follows:  |
| 8               | Acrylamide = $0.05\%$ dosed at 1 mg/L (or  |
|                 | equivalent)  |
| 8               | Epichlorohydrin = 0.01% dosed at 20 mg/L   |
|                 | (or equivalent)  |

| Total Dissolved Solids (TDS) | $500 \mathrm{\ mg/L}$         |
| Zinc                         | $5~\mathrm{mg/L}$             |

#### Noticeable Effects above the Secondary MCL

colored water salty taste

visible tint

metallic taste; blue-green staining metallic taste; corroded pipes/ fixtures

staining

tooth discoloration

frothy, cloudy; bitter taste; odor

rusty color; sediment; metallic taste; reddish

or orange staining

black to brown color; black staining; bitter

metallic taste

"rotten-egg", musty or chemical smell

low pH: bitter metallic taste; corrosion high

pH: slippery feel; soda taste; deposits

skin discoloration; graying of the white part

of the eye

salty taste

hardness; deposits; colored water; staining;

salty taste

# Noticeable Effects above the Secondary MCL metallic taste

| Dense underbrush  | 0.8              |

pander(nsheetflow\_notes)

| Note Number (*) | Notes   |
|-----------------|---|
| 1               | The n values are a composite of information   |
|                 | compiled by Engman $(1986)$ .                 |
| 2               | Includes species such as weeping lovegrass,   |
|                 | bluegrass, buffalo grass, blue grama grass,   |
|                 | and native grass mixtures.                    |
| 3               | When selecting n, consider cover to a height  |
|                 | of about 0.1 ft. This is the only part of the |
|                 | plant cover that will obstruct sheet flow.    |

# Greenhouse Gases – Percent Contribution to Total Greenhouse Effect (Wikipedia)

# load the data from iemiscdata [containingGreenhouse Gases -- Percent

### pander(greenhouse\_gases\_cloudy\_notes\_wikipedia)

| Note Number (*) | Notes  |
|-----------------|--|
| 1               | K&T (1997) used 353 ppm CO2 and              |
|                 | calculated 125 W/m2 total clear-sky          |
|                 | greenhouse effect; relied on single          |
|                 | atmospheric profile and cloud model. ""With  |
|                 | Clouds" percentages are from Schmidt         |
|                 | (2010) interpretation of K&T (1997).         |
| 2               | Schmidt (2010) used 1980 climatology with    |
|                 | 339 ppm CO2 and 155 W/m2 total               |
|                 | greenhouse effect; accounted for temporal    |
|                 | and 3-D spatial distribution of absorbers.   |
| 3               | Greenhouse gases not listed explictly in the |
|                 | table include sulfur hexafluoride,           |
|                 | hydrofluorocarbons and perfluorocarbons.     |
