# The Max-kCut Problem 

Adam Rahman

February 8, 2019

Similar to the Max-Cut problem, the Max-kCut problem asks, given a graph $\mathbf{G}=(\mathbf{V}, \mathbf{E})$ and an integer $k$, does a cut exist of at least size $k$. For a given (weighted) adjacency matrix $\mathbf{B}$ and integer $k$, the Max-kCut problem is formulated as the following primal problem

$$
\begin{array}{ll}
\underset{\mathbf{X}}{\operatorname{minimize}} & \langle\mathbf{C}, \mathbf{X}\rangle \\
\text { subject to }
\end{array} \quad \begin{aligned}
& \\
& \\
& \\
& \\
& \\
& \operatorname{diag}(\mathbf{X})
\end{aligned}=\mathbf{1} \quad . \quad \forall i \neq j
$$

Here, $\mathbf{C}=-(1-1 / k) / 2 *(\operatorname{diag}(\mathbf{B 1})-\mathbf{B})$. The Max-kCut problem is slightly more complex than the Max-Cut problem due to the inequality constraint. In order to turn this into a standard SQLP, we must replace the inequality constraints with equality constraints, which we do by introducing a slack variable $\mathbf{x}^{l}$, allowing the problem to be restated as

$$
\begin{array}{ll}
\underset{\mathbf{X}}{\operatorname{minimize}}\langle\mathbf{C}, \mathbf{X}\rangle \\
\text { subject to }
\end{array} \quad \begin{aligned}
& \\
& \operatorname{diag}(\mathbf{X})
\end{aligned}=\mathbf{1} \quad 1 /(k-1) \quad \forall i \neq j
$$

The function maxkcut takes as input an adjacency matrix $B$ and an integer $k$, and returns the optimal solution using sqlp.

```
R> out <- maxkcut(B,k)
```

## Numerical Example

To demonstrate the output provided by sqlp, consider the adjacency matrix

```
R> data(Bmaxkcut)
R> Bmaxcut
```

|  | V1 | V2 | V3 | V4 | V5 | V6 | V7 | V8 | V9 | V10 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: | ---: |
| $[1]$, | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 1 | 0 | 0 |
| $[2]$, | 0 | 0 | 0 | 1 | 0 | 0 | 1 | 0 | 1 | 1 |
| $[3]$, | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |
| $[4]$, | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 |
| $[5]$, | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 1 | 1 | 1 |

| $[6]$, | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $[7]$, | 1 | 1 | 0 | 0 | 1 | 0 | 0 | 1 | 1 | 1 |
| $[8]$, | 1 | 0 | 1 | 1 | 1 | 0 | 1 | 0 | 0 | 0 |
| $[9]$, | 0 | 1 | 0 | 0 | 1 | 1 | 1 | 0 | 0 | 1 |
| $[10]$, | 0 | 1 | 0 | 1 | 1 | 0 | 1 | 0 | 1 | 0 |

Like the max-cut problem, here we are interested in the primal objective function. Like the max-cut problem, we take the negated value. We will use a value of $k=5$ in the example.

```
R> out <- maxkcut(Bmaxkcut,5)
R> -out$pobj
[1] 19
```

Note also that the returned matrix X is a correlation matrix
