Import data

Data source

Data on divorces and marriages can be found on the Statbel site.

For most data we have the same information for marriages and divorces:

- municipality
- age
- civil state
- nationality
- profession

For marriages we have data from 2013-2016, for divorces 2012-2016. We'll limit ourselves to 2013-2016

Let's focus on age since a lot of interesting questions immediately come to mind:

- at what age do people marry?
- at what age do people divorce?
- what's the age difference between people marrying?

Download data

```
types <- c("divorce", "marriage")
years <- paste0("201", 3:6)

rep_years <- rep(years, times = length(types))
rep_types <- rep(types, each = length(years))

purrr::walk2(.x = rep_years,
             .y = rep_types,
             ~download(year = .x, type = .y))
```
