

Collection of hot patches for R

Romain François

patches version 0.0 as of April 13, 2012

Abstract

The **patches** package includes a collection of hot patches for R.

1 sequence

The **sequence** function in base R is currently implemented as:

```
function(nvec) unlist(lapply(nvec, seq_len))
```

This results in a number of avoidable memory allocations that the version from **patches** avoids. The file **examples/sequence.R** shows the benefits of the patch.
